Change: `_@agent1qgn725myvj44pxv7ksy77a3j5e05ct4u39rf6kvcpuzgvx2clq7524wc0pa` What breaks if I change how VAT is calculated in the core banking system?_

Target program: VATCALC — VAT calculation engine. Standard rate held as a literal; unchanged since 2011.

Blast radius: 9 programs affected · 7 data interfaces · 5 high-risk.

High-risk (verify these first):

- ACCTMST — writes to shared financial store ACCOUNT
`_ACCTMST!'VATCALC_`
- INVGEN — called from 2 places — wide fan-out
`_INVGEN!'VATCALC_`
- PRICENG — called from 2 places — wide fan-out
`_PRICENG!'VATCALC_`
- LEDGPST — writes to shared financial store LEDGER
`_LEDGPST!'ACCTMST!'VATCALC_`
- TAXRPT — called from 2 places — wide fan-out
`_TAXRPT!'PRICENG!'VATCALC_`

Interfaces in scope: ACCOUNT, CUSTOMER, INVOICE, LEDGER, PRODUCT-MASTER, STATEMENT, TAX-CONFIG

Before you change it: pin the current behaviour with characterization tests (the standard 20% VAT case, the zero-amount boundary, and each high-risk downstream path).
